A diagnosis of bladder cancer begins with a thorough discussion with your doctor. In addition to reviewing your symptoms, your doctor may ask you questions about bladder cancer risk factors, like whether you smoke cigarettes (or have a history of it) or whether you have any chemical exposures in the workplace.

Cancer staging is the process of determining the extent to which a cancer has developed by growing and spreading. Contemporary practice is to assign a number from I to IV to a cancer, with I

being an isolated cancer and IV being a cancer which has spread to the limit of what the assessment measures.

Even if you feel fine, you should still see your provider for regular checkups. These visits can help you avoid problems in the future. For example, the only way to find out if you have high blood pressure is to have it checked regularly. High blood sugar and high cholesterol level also may not have any symptoms in the early stages. Simple blood tests can check for these conditions.

Screening tests are an important part of your preventive health care. The tests can be used for early detection of some of the more common and potentially deadly diseases, such as cancers, diabetes, and heart disease. These tests can find certain illnesses in their earliest and most curable stages, even before you notice symptoms.

### **Screening Tests for Adults (50 and Up)**

Since the early 1990s, prostate cancer death rates have been decreasing in men of all races and ethnicities. However, they remain more than twice as high in blacks as in any other group. [] Prostate cancer tends to not only be more aggressive and progressive in black men, leading to advanced disease, but to also be of a higher grade at diagnosis.
