An object can store energy as the result of its position. For example, the heavy ball of a demolition machine is storing energy when it is held at an elevated position. This stored energy of position is referred to as potential energy. Similarly, a drawn bow is able to store energy as the result of ...

Measuring the Mass of the Earth Measuring the acceleration of an object dropped to the ground enables you to find the mass of the Earth. You can rearrange the gravity acceleration relation to solve for the mass M to find $M = g d^2 / G$. Close to the Earth's surface at a distance of 6.4×10^6 meters from the center, $g = 9.8$ meters/second². The distance is given in meters to match the units of ...

During their physics field trip to the amusement park, Tyler and Maria took a rider on the Whirligig. The Whirligig ride consists of long swings which spin in a circle at relatively high speeds. As part of their lab, Tyler and Maria estimate that the riders travel through a circle with a radius of 6 ...

The letter "k" has been used for over a century in the fields of optics, acoustics, mechanics, and electromagnetism to refer to the spatial frequency of waves in various media. The idea of a "k-trajectory" or "k-space" was not applied to NMR until the early 1980s and did not become popular until the 1990s.

The terms linear polarization (LP) and circular polarization (CP) derive from classical

electromagnetic theory describing two modes of wave propagation. Readers may be more familiar with these concepts from optics, where polarizing lenses like those used in sunglasses allow light rays oscillating in a specified constrained (linear) dimension to pass through while blocking all others.

Although van Leeuwenhoek was not the inventor of the microscope, he advanced it more than anyone else for seeing living things. He started bacteriology and protozoology, he advanced parasitology, and he accurately described many human cells, including red and white blood cells, sperm, and other human tissues (e.g. skeletal muscle).

In physics, a force is any interaction that, when unopposed, will change the motion of an object. A force can cause an object with mass to change its velocity (which includes to begin moving from a state of rest), i.e., to accelerate. Force can also be described intuitively as a push or a pull. A force has both magnitude and direction, making it a vector quantity.
