Learning a multitude of ways to approach a problem is part of the philosophy in developing sets of
problemsolving strategies. Several strategies are presented as methods of attacking the problems:
choosing an operation, finding a pattern, estimating, using a chart, using a formula, and many
more.

In plane geometry, a chord is the line segment joining two points on a curve. The term is often used to describe a line segment whose ends lie on a circle. The term is also used in graph theory, where a cycle chord of a graph cycle C is an edge not in C whose endpoints lie in C . In the above figure, R is the radius of the circle, a is the chord length, r is called the apothem, and h the sagitta.

A secant line, also simply called a secant, is a line passing through two points of a curve. As the two points are brought together (or, more precisely, as one is brought towards the other), the secant line tends to a tangent line. The secant line connects two points $(x, f(x))$ and $(a, f(a))$ in the Cartesian plane on a curve described by a function $y=f(x)$.
